

Clinical dermatology and transdermal delivery system (TDDS) services have been expanded to four clinical facilities. With this service expansion, clinical dermatology and TDDS multisite studies for adhesion, irritation, and sensitization (A/I/S) trials can be conducted across facilities in Miami, St. Louis, and Toronto, in addition to the Fargo, ND facility. Personnel training and specific study processes have been harmonized across the four clinical sites, and A/I/S studies have been conducted at these multiple sites using identical scoring and performance standards with the same protocol and comprehensive final report within one full-service package. Sponsors are assisted with the new regulatory recommendations, including compliance with FDA guidance.
