

ChemiFast is a new chemiluminescence substrate that is sensitive and produces a signal that is stable for up to 24 hours, making it useful for detecting even faint protein bands on Western blots. The new ChemiFast is optimized for use with chemiluminescent imagers such as the G:BOX Chemi range or GeneGnome. ChemiFast is recommended for use with highly diluted primary and secondary antibody concentrations, allowing researchers to detect femtogram levels of protein.
