

The new Ribo-Zero rRNA removal kit (human/mouse/rat) removes >99% of the 28S, 18S, and 5.8S, and >95% of the 5S rRNA from both intact and partially degraded human, mouse, and rat total RNA preparations. The kit provides an ideal solution for users who are preparing RNA-Seq libraries from human, mouse, or rat total RNA, especially from compromised samples such as formalin-fixed, paraffin-embedded tissue.
